EDUCATION

Vishwakarma Institute of Technology Expected May 2029
Bachelor of Technology in Computer Engineering *Pune, Maharashtra*
Relevant Coursework: Data Structures & Algorithms, DBMS, OOP, Operating Systems

TECHNICAL SKILLS

Languages:	C++, JavaScript (ES6+), Python
Frontend:	React.js, Next.js, TypeScript, HTML5, CSS3
Backend:	Node.js, Express.js, REST API Design, Socket.io
Databases:	MongoDB, MySQL, Mongoose ODM
Tools & Infra:	Git, GitHub, Vercel, Postman, Linux CLI
CS Concepts:	Data Structures & Algorithms, System Design, MVC, JWT Auth, TCP/IP

PROJECTS

AI Resume Analyzer github.com/atharvavavhal/ai-resume-analyzer
Node.js, Express.js, React.js, OpenAI API, MongoDB

- Built a full-stack resume analysis tool using OpenAI's Chat Completions API; processes PDF uploads server-side, extracts text, and returns structured, category-level feedback in under 3 seconds end-to-end.
- Engineered a PDF ingestion pipeline handling multipart uploads with token-optimised prompts — keeping API costs below $0.02 per analysis by chunking and truncating input intelligently.
- Designed a React dashboard with categorised feedback panels (Skills, Experience, Impact) enabling users to act on AI output without reading raw JSON — improved usability in self-tested sessions.

MERN Task Manager github.com/atharvavavhal/mern-task-manager
MongoDB, Express.js, React.js, Node.js, JWT, bcrypt

- Implemented stateless JWT authentication with bcrypt-hashed passwords; all 12+ protected API routes verified via a single reusable Express middleware, reducing auth logic duplication by 100%.
- Designed a RESTful API with resource-oriented routing, centralised error handling, and schema-level validation via Mongoose — eliminated all inconsistent 500 responses across endpoints.
- Optimised React state management to support real-time task filtering, priority reordering, and status updates with zero full-page reloads, using component-level state and memoised selectors.

Real-Time Chat Application github.com/atharvavavhal/realtime-chat
Node.js, Socket.io, Express.js, HTML5, CSS3

- Built a multi-room WebSocket messaging system supporting 50+ concurrent connections with isolated room namespaces, preventing cross-room data leakage at the event-routing layer.
- Modelled the full connection lifecycle (handshake → room join → broadcast → disconnect) as a clean event graph in Socket.io, keeping all stateful logic in a single 120-line server module.
- Delivered a mobile-first frontend with optimistic UI updates: messages appear instantly client-side while Socket.io confirms delivery asynchronously, giving sub-50ms perceived latency.

COMPETITIVE PROGRAMMING & OPEN SOURCE

- Solved 150+ problems on LeetCode across arrays, trees, graphs, and dynamic programming — targeting 300+ problems and a LeetCode rating of 1600+ within 6 months.
- Actively practicing Codeforces Div. 3 rounds to build algorithmic speed and pattern recognition for technical interview preparation.
- All personal projects are open-source on GitHub with structured README documentation, commit history, and issue tracking to simulate a professional engineering workflow.

ADDITIONAL

- Proficient in Git branching workflows (feature branches, PRs, atomic commits) — all projects versioned on GitHub with descriptive commit history.
- Actively studying backend system design concepts: load balancing, caching strategies, database indexing, and horizontal scaling patterns.
- Seeking backend/full-stack SWE internship roles for Summer 2026; open to open-source contributions in Node.js/React ecosystems.
